Microbiological cleanliness of the production installation in chemical and pharmaceutical plants is a key importance in obtaining the appropriate quality of finished products and raw materials intended for further pharmaceutical production and products for diagnostic tests.

Microorganisms developing inside technological installations, especially those capable of producing biofilm, pose significant problems in maintaining the appropriate cleanliness of production lines, and thus in constantly maintaining the appropriate quality requirements of the finished product.

After analyzing the needs of our company and the solutions available on the market, a decision was made to choose the HydroFLOW 601 device. Due to its installation on production, it was found that the high quality goals set for our products, we can achieve much easier thanks to a significant level reduction of microbiological risk, associated with the microbes appearance in the production installation.
