Mr. Brazell,

The University of Utah had three *HydroFLOW hs40* units installed in the Athletics facilities last year. I have seen remarkable improvement in not only the appearance, but also the functionality of our treadmill therapy pools. Our chemical use significantly reduced, moreover, increased clarity of the pool has been noticed by the State Health Department.

Because larger mineral particles are created by *HydroFLOW*, our filters work more efficiently. It is interesting to note that one of the pools suffered from rust and copper issues, which caused the water to have a green hue. We have been trying to solve this problem for years, to no avail. Two weeks after we installed the *hs40*, the water slowly started to become blue, and almost a year later, remains blue.

Therapy pools

Before - Pool with green hue

After - Pool with blue hue

We have been very impressed by the results of the *HydroFLOW* water conditioning devices in our facility and highly recommend them for pool applications.
